In Animal Weapons: The Evolution of Battle, Douglas Emlen explores the different weapons and competitions that exist in the animal kingdom. Emlen lays out the conditions that lead to the evolution of weapons and arms-races in a species, examines their effects and consequences on that populations, and then draws parallels to the evolution of weapons and warfare among humans.

to explain the processes behind the most intriguing and curious examples of extreme animal weapons—fish with mouths larger than their bodies and bugs whose heads are so packed with muscle they don't have room for eyes. As singular and strange as some of the weapons we encounter on these pages are, we learn that similar factors set their evolution in motion. Emlen uses these patterns to draw parallels to the way we humans develop and employ our own weapons, and have since battle began. He looks at everything from our armor and camouflage to the evolution of the rifle and the structures human populations have built across different regions and eras to protect their homes and communities. With stunning black and white drawings and gorgeous color illustrations of these concepts at work, *Animal Weapons* brings us the complete story of how weapons reach their most outsized, dramatic potential, and

what the results we witness in the animal world can tell us about our own relationship with weapons of all kinds.

Join scientist Doug Emlen on his quest to find out why an elusive type of beetle grows weapons that are enormous for its body size. What does it take to be a scientist in the field? Doug Emlen is a scientist. He studies beetles. Specifically, he studies the evolution of beetle weapons—how their horns and armor change to better suit them in different environments. This book starts with a mystery: Doug wanted to know why a particular type of beetle developed a massive evolutionary weapon. He wanted to know how these changes happened and what advantages these enormous weapons gave the tiny dung beetles. So, he went to visit. Part travel diary and part scientific exploration, *Beetle Battles* takes you deep into the South American rainforest to

Contests are an important aspect of the lives of diverse animals, from sea anemones competing for space on a rocky shore to fallow deer stags contending for access to females. Why do animals fight? What determines when fights stop and which contestant wins? Addressing fundamental questions on contest behaviour, this volume presents theoretical and empirical perspectives across a range of species. The historical development of contest research, the evolutionary theory of both dyadic and multiparty contests, and approaches to experimental design and data analysis are discussed in the first chapters. This is followed by reviews of research in key

animal taxa, from the use of aerial displays and assessment rules in butterflies and the developmental biology of weapons in beetles, through to interstate warfare in humans. The final chapter considers future directions and applications of contest research, making this a comprehensive resource for both graduate students and researchers in the field.

From one of the world ' s leading authorities on animal behavior, the astonishing story of how the brain drives the evolution of beauty in animals and humans In A Taste for the Beautiful, Michael Ryan, one of the world ' s leading authorities on animal behavior, tells the remarkable story of how he and other scientists have taken up where Darwin left off, transforming our understanding of sexual selection and shedding new light on animal and human behavior. Drawing on cutting-edge science,

Ryan explores key questions: Why do animals perceive certain traits as beautiful and others not? Do animals have an inherent sexual aesthetic and, if so, where is it rooted? Ryan argues that the answers lie in the brain—particularly of females, who act as biological puppeteers, spurring the development of beautiful traits in males. Vividly written and filled with fascinating stories, *A Taste for the Beautiful* will change how you think about beauty and attraction in the animal world and beyond.

animal world. In the great halls of science, dogma holds that Darwin's theory of natural selection explains every branch on the tree of life: which species thrive, which wither away to extinction, and what features each evolves. But can adaptation by natural selection really account for everything we see in nature? Yale University ornithologist Richard Prum—reviving Darwin's own views—thinks not. Deep in tropical jungles around the world are birds with a dizzying array of appearances and mating displays: Club-winged Manakins who sing with their wings, Great Argus Pheasants who dazzle prospective mates with a four-foot-wide cone of feathers covered in golden 3D spheres, Red-capped Manakins who moonwalk. In thirty years of fieldwork, Prum has seen numerous display traits that seem disconnected from, if not outright contrary to, selection for individual survival. To explain this, he dusts off Darwin's long-

neglected theory of sexual selection in which the act of choosing a mate for purely aesthetic reasons—for the mere pleasure of it—is an independent engine of evolutionary change. Mate choice can drive ornamental traits from the constraints of adaptive evolution, allowing them to grow ever more elaborate. It also sets the stakes for sexual conflict, in which the sexual autonomy of the female evolves in response to male sexual control. Most crucially, this framework provides important insights into the evolution of human sexuality, particularly the ways in which female preferences have changed male bodies, and even maleness itself, through evolutionary time. *The Evolution of Beauty* presents a unique scientific vision for how nature's splendor contributes to a more complete understanding of evolution and of ourselves.

exploration of the origin and function of storytelling, the author goes beyond the work of mythologist Joseph Campbell, arguing that mythmaking evolved as a cultural survival strategy for coping with the constant fear of being killed and eaten by predators. Beginning nearly two million years ago in the Pleistocene era, the first stories, Trout argues, functioned as alarm calls, warning fellow group members about the carnivores lurking in the surroundings. At the earliest period, before the development of language, these rudimentary "stories" would have been acted out. When language appeared with the evolution of the ancestral human brain, stories were recited, memorized, and much later written down as the often bone-chilling myths that have survived to this day. This book takes the reader through the landscape of world mythology to show how our more recent ancestors created myths that portrayed

animal predators in four basic ways: as monsters, as gods, as benefactors, and as role models. Each incarnation is a variation of the fear-management technique that enabled early humans not only to survive but to overcome their potentially incapacitating fear of predators. In the final chapter, Trout explores the ways in which our visceral fear of predators is played out in the movies, where both animal and human predators serve to probe and revitalize our capacity to detect and survive danger. Anyone with an interest in mythology, archaeology, folk tales, and the origins of contemporary storytelling will find this book an exciting and provocative exploration into the natural and psychological forces that shaped human culture and gave rise to storytelling and mythmaking.

seeks to demonstrate how anthropomorphism and gender politics have affected our knowledge of the natural world and shows how a broader approach, based on feminist biology, can bring about a more rounded understanding.

The animals of Manor Farm have revolted and taken over. Upon the death of Old Major, pigs Snowball and Napoleon lead a revolt against Mr. Jones, driving him from the farm. The animals embrace the Seven Commandments of Animalism and life carries on, but they learn that a farm ruled by animals looks more human than ever. Intended as a critique of Stalinist-era Russia, Orwell ' s satirical novella *Animal Farm* is one of his greatest literary achievements. *Animal Farm* was chosen as one of Time magazine ' s 100 best English-language novels, and won a Retrospective Hugo Award in 1996.
