In a time of grief over his first romantic misunderstanding, Nelson realized that his feelings had to be expressed. Worrying about not wanting to bore anyone with his problems and realizing the amount of long hours he worked in front of a computer, he realized that writing out exactly what was felt during intense moments seemed to ease the pain. Not knowing that there would soon be a whole collection of poems as he continued writing about other romantic situations, he made the poems into a file that would be kept only for himself. After meeting someone very special, his first true love, he wrote much more and made the file into a chapter that would at some point be made into a complete book including other serious and comic poems. And so, this book is a collection of four chapters that examine humor, family,

After having won multiple contests, being published by Poetry.com, and drawing a crowd of interested readers by being placed regularly in Berkeley College's school newsletter, Nelson is finally releasing all of his earliest work for others to read. The "New Poet" hopes that his honesty, creativity, comic wit and deepest feelings will get others into reading, understanding, writing, and most importantly, enjoying the art of poetry. machines that can barely be seen by the naked eye. They also run a great diversity of fuel types, from various types of commercial gases to waste-generated gases. This new book by industry expert Claire Soares will fully describe the various types of microturbines, their applications, and their particular requirements for installation, maintenance and repair. It will explain how a microturbine the size of a refrigerator can power an entire school, hospital or small factory, which is particularly useful for onsite, remote installations. The book will also show how microturbines can be paired with one or more fuel cells to form a hybrid energy source, or can be teamed with any source of distributed power, such as a small hydro-turbine or a wind turbine. Moreover, the reader will learn how microturbines can run on a variety of fuels that are far cruder than those required by most standard gas turbines; they can be made to run, for instance, using gas from a landfill or biomass
