the morse test can be used to measure the indicated power and mechanical efficiency of multi cylinder engines . The engines test is carried out as follows . The engine is run at maximum load at certain speed . The B.P is then measured when all cylinders are working . Then one cylinder is made in operative by cutting off the ignition to that cylinder .

**MORSE TEST ON MULTI CYLINDER PETROL ENGINE**

The engine is run at the required speed and the torque is measured. One cylinder is cut out by shorting the plug if an S.I. engine is under test. The speed falls because of the lass of power with one cylinder cut out but is restored by reducing the load. The torque is measured again when the speed has reached its original value.

An internal combustion engine (ICE) is a heat engine where the combustion of a fuel occurs with an oxidizer (usually air) in a combustion chamber that is an integral part of the working fluid flow circuit. In an internal combustion engine, the expansion of the high-temperature and high-pressure gases produced by combustion applies direct force to some component of the engine.
