Advances in healthcare have led to an extended life expectancy throughout the developed world, but cognitive impairment in later life, and Alzheimer's disease (AD) in particular, remains one of the intractable problems which can blight quality of life as we age. Depression in Alzheimer's disease is an additional factor which has a significant impact on disability, disease progression, and caregiver burden. This book, volume 4 of the Advances in Alzheimer's Disease book series which is published in coordination with the Journal of Alzheimer's Disease, presents papers which reflect the progress in recent years of research into depression in AD. This research has focused on several areas, including the improvement of diagnostic criteria and outcome measures for depression and depressive symptoms in AD, genetic and imaging studies to elucidate the neurobiological mechanisms, and clinical trials of antidepressants. The book is divided into sections on phenomenology, epidemiology, neuropsychology, neurobiology and neuropathology, neuroimaging, genetics, and treatment. Providing a stimulus to further research in this challenging area by engaging both basic and clinical researchers, this book will be of interest to

L'hypertension artérielle, qui est soignée chez près de 8 millions de personnes en France, constitue un fréquent motif de consultation chez le médecin généraliste et le cardiologue. Toutefois, du fait de son caractère asymptomatique ou de son association avec d'autres maladies, elle reste une pathologie difficile à appréhender.

L'hypertension artérielle étant une maladie chronique dont la prise en charge s'effectue sur plusieurs années, ce guide pratique, dont la lecture est facilitée par de nombreux tableaux et arbres décisionnels, apporte ainsi au médecin toutes les informations pratiques sur la démarche diagnostique et thérapeutique de prise en charge du patient hypertendu et lui donne tous les éléments nécessaires pour répondre aux questions de ses patients. Cette 3e édition du Guide pratique de l'hypertension artérielle prend en compte les dernières recommandations de bonnes pratiques émises par les sociétés savantes et les organismes de santé.

The aim is to produce a really practical manual that gives clearly presented guidelines to the ordinary practitioner about what to do in given circumstances. It will be a bench book on hypertension, in which its various aspects are dealt with from a clinical perspective, and where the text is constructed, laid out, and illustrated, in such a way as to make the work of maximum utility and readability to the practitioner. Clear, authoritative guidelines help readers arrive at the most effective methods for treating patients with high blood pressure. User-friendly format features illustrations, graphics, and a carefully constructed layout designed for easy clinical reference. Evidence-based information on patient management relies on scientific research as the basis for treatment. Expert contributors offer an authoritative perspective on their areas of expertise, masterfully edited into one unified reference.

Projections for advances in medical and biological technology will transform medical care and treatment. This in great part is due to the result of the interaction and collaboration between medical sciences and engineering. These advances will result in substantial progress in health care and in the quality of life of the population. Frequently however, the implications of technologies in terms of increasing recurrent costs, additional required support services, change in medical practice and training needs are underestimated. As a result, the widespread irrational use of technologies leads to a wastage of scarce resources and weakens health systems performance. To avoid such problems, a systematic and effective Health Technology System must be developed and introduced, requiring the support and commitment of decision makers of all levels of the health system. The MediTech2009 conference aims to provide a special opportunity for the Romanian professionals involved in basic - search, R&D, industry and medical applications to exchange their know-how and build up collaboration in one of the most human field of science and techniques. The conference is intended to be an international forum for researchers and practitioners interested in the advance in, and applications of biomedical engineering to exchange the latest research results and ideas in the areas covered by the topics (and not only!). We believe the reader will find the proceedings an impressive document of progress to date in this rapidly changing field.

Nutritional Cognitive Neuroscience is an emerging interdisciplinary field of research that seeks to understand nutrition's impact on human cognition and brain health across the life span. Research in this burgeoning field demonstrates that many aspects of nutrition – from entire diets to specific nutrients – affect brain structure and function, and therefore have profound implications for understanding the nature of psychological health, aging, and disease. The aim of this Research Topic in *Frontiers in Aging Neuroscience* is to examine recent empirical and theoretical

contributions from Nutritional Cognitive Neuroscience, with an emphasis on the following primary areas of inquiry. **Nutrition and Brain Health** An enduring aim of research in the nutritional sciences is to discover specific nutrients and dietary patterns that enhance cognitive function and brain health in the elderly. Although an abundance of evidence supports a single or a few nutrients for the promotion of cognitive performance and brain health, clinical trials using nutritional supplementation have been predominately unsuccessful. Further research is therefore needed to better characterize the contributions of specific nutrients and nutrient combinations to cognitive performance and brain health.

Moderators of Nutrition's Impact on the Brain A second major area of research in Nutritional Cognitive Neuroscience investigates the mechanisms that underlie the effects of nutrition on brain health at the cellular, molecular, and circuit levels. Accumulating evidence indicates that the effects of nutrition on brain health are complex and multifactorial, reflecting the influence of particular nutrient combinations on specific brain networks and taking into account several moderating factors. Considerably more research is needed to elucidate the complex interactions between nutrition and known moderating variables – including age, nutritional status, genes, environment, and lifestyle – in determining nutrition's impact on cognitive function and brain health.

Personalized Nutrition Research at the frontiers of Nutritional Cognitive Neuroscience establishes a personalized approach to nutritional intervention that takes into account individual variability in nutritional status, brain health, genes, environment, and lifestyle. The goal of personalized nutrition is to enhance the precision of nutritional intervention and to enable novel applications to psychological health, aging, and disease.
