433MHz RF Remote control system with PIC microcontroller This project shows how to use low cost 433MHz RF transmitter/receiver modules to build a 5-channel wireless RF remote control system using 2 x PIC12F1822 microcontrollers. The used RF modules in this project are cheap and easy to use with any microcontroller.

8-bit MCUs. Our 8-bit PIC ® and AVR ® microcontrollers help developers of all skill levels to easily bring their ideas to life. Use the combination of readily customizable peripherals and the industry's most code-efficient architectures to bring multiple functions to a single chip with minimal programming.

The usual steps taken for designing microcontroller based embedded system using microcontroller circuit design software are-1. Create a schematic of the design 2. Create Program for the microcontroller 3. Upload the program to the microcontroller 4. Stimulate the design 5. Fix errors and restimulate 6. Create PCB and implement the physical design 7.

The PIC microcontroller from Microchip is one the famous and most used microcontrollers. Because of its reliability it is commonly preferred by embedded engineers for industrial applications. The below list of PIC Tutorials and PIC Projects helps you to learn PIC series of microcontrollers from very basic level to advanced applications.

PIC Microcontroller Projects and Tutorials

The Proteus Design Suite is able to simulate many of the popular 8 and 16-bit PIC devices along with other circuitry that is connected to the PIC on the schematic. The program to be simulated can be developed within Proteus itself, MPLAB or any other development tool.

MPLAB X is an IDE (integrated development environment) that provides all the tools needed to code a PIC project, including color-coded text editors, debugging controls, memory view, device configuration, and much more. XC8 is the C compiler that allows us to use the C programming language to design programs for the PIC16 and PIC18 range.
