In all ultrasound-guided paravertebral block techniques, an indication of correct needle tip placement is the anterior displacement of the parietal pleura when the solution of local anaesthetic is being injected. Hydrolocation with saline can be used to help with needle tip position; this is particularly useful when the anatomy on

Paravertebral nerve blockade is considered an advanced technique due to the proximity of the neuraxis, pleura, abundant vasculature and other ' danger zones '. The risk of pneumothorax associated with the traditional technique (' walking ' the block needle off a transverse process into the paravertebral space), with or without ultrasound guidance, remains high 1 , 2 .

Thoracic Paravertebral Block - Nerve Blocks

INTRODUCTION. Traditionally, lumbar plexus block (LPB) is performed using surface anatomical landmarks to identify the site for needle insertion and eliciting quadriceps muscle contraction in response to nerve electro-localization, as described in the nerve stimulator-guided chapter. The main challenges in accomplishing LPB relate to the depth at which the lumbar plexus is located and the size of the plexus, which requires a large volume of local anesthetic for success.
