This is a new edition for November 2013. If you own a classic car, you face the problem of choosing the appropriate modern lubricants to use in its engine, gearbox, final drive and chassis. The original owner's handbook, if you have one, is probably of limited use as the lubricants it lists are probably no longer available. Even if you have some good information, you still have problems: are modern oils suitable? If yes, which ones? (Even within a single brand there may be five or six different oils sold for apparently the same purpose.) If no, then why not? What characteristics are unsuitable, and where do you turn to obtain an appropriate oil? This book gives all owners the information that will allow them to understand the lubrication needs of their cars, and to relate those needs to modern lubricants. You will be able to make correct and safe choices, or to seek out appropriate specialised lubricants if necessary, using step-by-step instructions. Answers are also given to many of the most commonly asked questions about suitable oils for classic cars.

The military lube orders for combat and tactical equipment call for single viscosity grade oils. The use of this type oil results in frequent oil changes caused by seasonal and climatic temperature changes. The use of a single 'year-round' lubricant could eliminate the seasonal changes, possibly extend the oil drain interval, and provide a greater degree of combat readiness. MERADCOM began a pilot program to determine the feasibility of utilizing synthetic arctic engine oil in combat/tactical equipment outside arctic regions. The program involved M60A1 tanks and M151A2 jeeps at selected CONUS military installations. After extensive field testing and evaluation, it was determined that use of the synthetic lubricant had no adverse effect on the equipment. However, environment conditions and maintenance procedure greatly influenced the test results, causing high amounts of silicon to be injected. Thus, the normal oil drain intervals were not changed nor has a change in the vehicle engine failure/removal resulted. (Author).
